

Herein, we have successfully developed a transmission-type daytime radiation cooling system and designed a tandem structure that integrates daytime radiative cooling with solar cells.

We demonstrated simultaneous subambient daytime radiative cooling at 5.1°C temperature reduction under solar irradiance $\sim 1,000 \text{ W/m}^2$ and solar power generation up to 159.9 ...

To address the significant challenge of harmonizing radiative cooling with solar energy harvesting into a cohesive system, researchers have introduced two innovative solutions, each offering a distinct ...

Their study details the design and empirical validation of a system capable of simultaneous sub-ambient daytime radiative cooling and PV power generation from the same ...

The implications of this compromise for sustainability and energy efficiency raise critical questions about the impact of radiative cooling technology if it necessitates forgoing the potential ...

The review thoroughly analyses TEG system configurations, performance, and applications driven by solar and/or radiative cooling, covering non-concentrating, concentrating, ...

Despite the great theoretical potential of coharvesting the cold universe and the sun as renewable resources, subambient daytime radiative cooling and significant solar power generation ...

In this paper, to solve the problem that the power generation of currently developed all-day radiative cooling driving thermoelectric generator (RC-TEG) devices is very small, a promising ...

We present a simple model showing the optimum power density can be approached by controlling the relation between the emitter area and the thermal resistance of the thermoelectric ...
