

The KYOCERA AVX 500 capacitors' significant electrical advantages and thermal stability combined with their rugged, laser-marked, surface-mount package provide designers with uniquely versatile devices to help meet ...

COG: Class I (Also known as "NPO") Temperature Compensating capacitors, suitable for resonant circuits where stable capacitance and high Q are necessary. They are made of non ferro-electric materials yielding superior ...

It is one of the most highly stable capacitors. It has very predictable temperature coefficients (TCs) and, in general, does not age with time.

DiA high temperature capacitors offer very stable performance when compared to typical MLCC components. At temperature above 150°C, the X7R and X8R capacitors suffer from severe

In 2025, NPO capacitors will be central to high-frequency filters in 5G infrastructure and advanced wireless devices. Their stable capacitance ensures minimal signal distortion, leading to...

COG (NPO) - Capacitance change with temperature is 0-30ppm/°C which is less than -0.3%/°C from -55°C to +125°C. Typical capacitance change with life is less than -0.1 % for NPOs, one-fifth that shown by most ...

Features: Designed with high-quality and durable materials. A wide array of special testing to meet specific quality capacitor requirements. Typically, offered NP0/COG and X7R materials in SMT capacitors. Special ...

NPO capacitors are one of the most stable capacitors in terms of capacitance and dielectric loss. The capacitance changes at 0-30ppm/°C in the range of -55°C to +125°C, and the capacitance changes ...

NPO High Voltage Ceramic Chip Capacitors are designed to provide stable and reliable performance in high voltage applications. They are used in industries such as telecommunications, ...

Ceramic Chip Capacitors NPO & COG Dielectric. Application General Specification.
