

How many years is the life of a wind turbine generator set

How long do wind turbines last?

On average, the expected service life of a wind turbine is approximately 25 years, but this doesn't mean that each component is meant to last for 25 years. There are several ways to extend the lifespan of wind turbines. High-quality materials and an aerodynamic design are important for maximising the energy capacity of turbines.

How can the lifecycle of a wind turbine be extended?

The lifecycle of a turbine can be extended through careful monitoring and maintenance. This requires the condition of the asset to be assessed and compared with the expected lifespan of the turbine, based upon the expected loads and fatigue as well as environmental factors for the wind energy site.

What factors determine a wind turbine's life?

What Factors Determine a Wind Turbine's Life? Modern wind turbines are designed to last 20 years and with proper monitoring and preventative maintenance two to three times per year (increasing with frequency as the turbine ages) their lifetime can be extended to 25 years.

How does repowering affect the lifespan of a wind turbine?

Many components are often upgraded during repowering efforts to enhance performance and extend the overall lifespan of the turbine. Steps taken to optimise the operation of wind farms have a significant impact on turbine lifespan. These include optimising load and shutting down turbines if the wind is too strong.

This ensures a more sustainable lifecycle for wind energy. Conclusion In summary, a modern wind turbine is engineered for a productive operational life of **20 to 25 years**. This lifespan ...
