

The power consumption of micro and macro base stations is investigated based on the traffic load. Energy and traffic measurements were carried out for ten consecutive days on six base stations ...

In particular, the existing productive and service sectors in Nepal, above all tourism, which makes up a major economic factor for the country, benefit from improved load management and the resulting ...

The power supply has significantly improved after 2017 through additions to domestic generation capacity, improved load management, and increased imports from neighboring India, and ...

This paper critically analyses the power consumption of Base Stations (BSs) as per the traffic generated at various urban-dense location of Kathmandu. It deals with real time traffic data on full load in per ...

This paper investigates changes in the power consumption of base stations according to their respective traffic and develops a model for the power consumption as per traffic generated aiming to highlight ...

This paper critically analyses the power consumption of Base Stations (BSs) as per the traffic generated at various urban-dense location of Kathmandu, Nepal. It deals with real time traffic data on full load in ...

In these circumstances, automatic generation control (AGC), commonly referred to as load frequency control, is utilized with the primary goal of minimizing transient error deviations in both the frequency ...

For years, Nepal faced one of its biggest infrastructural challenges--load shedding, or prolonged power cuts, lasting up to 18 hours a day. This crisis severely impacted industries,...

After end of decades of loadshedding, the power system of Nepal is moving towards the scenario of self-sufficiency. The Government of Nepal has formulated a policy to add 20 GW of hydropower in the ...
