

In this paper the bending behaviour of PV panels with various boundary conditions is analysed and the influence of boundary condition is studied carefully.

The present work focuses on the solar-grade multi-crystalline silicon used in PV wafers. The aim is to characterize the Young's modulus and to analyze the fracture behavior at room ...

We here give a synopsis on established analytical approaches used to predict effective values as well as a review on experimental outcomes at crystal and aggregate level.

In this chapter, we discuss the reliability and various failure modes that have been recorded for various PV technologies over the last few years through field and laboratory test...

IEC 61215 (Standard for crystalline silicon terrestrial PV modules) gives guidelines on solar panel mechanical load, climate, and electrical characteristics tests.

In this work, a 3D FE model is used to investigate the stresses which are generated from mechanical loading and the XFEM to predict the crack initiation and propagation. Several aspects ...

Testing revealed significant differences in the ability of the encapsulant to protect the solar cells from damage due to mechanical loading at various temperatures, with the encapsulant modulus being a ...

This study provides important design guidance to the Photovoltaic (PV) solar panel development efforts using the finite element based computations of the PV module under the ...

We present a set of thermomechanical design rules to support and accelerate future (PV) module developments. The design rules are derived from a comprehensive parameter sensitivity ...

The elastic modulus of the encapsulant (EVA) was varied between the value of 0.05-50 MPa (that covers the temperature range from about 120 C to -20 C (Paggi et al., 2011)) to check the sensitivity ...
