Using the MATLAB/Simulink platform, a model of the traction power system with SMES for a large subway station with multiple lines was constructed.

Overview Advantages over other energy storage methods Current use System architecture Working principle Solenoid versus toroid Low-temperature versus high-temperature superconductors Cost Superconducting magnetic energy storage (SMES) systems store energy in the magnetic field created by the flow of direct current in a superconducting coil that has been cryogenically cooled to a temperature below its superconducting critical temperature. This use of superconducting coils to store magnetic energy was invented by M. Ferrier in 1970. A typical SMES system includes three parts: superconducting coil, power conditioning system and cry...
