A glossary listing common acronyms, abbreviations and measurements used in Australia's energy industry.

Energy management systems (EMSs) are required to utilize energy storage effectively and safely as a flexible grid asset that can provide multiple grid services. An EMS needs to be able to accommodate ...

To efficiently manage and distribute power throughout the vehicle, power distribution modules (PDMs) play a crucial role. All the well-known aftermarket ECU manufacturers are also making PDMs. Motec, ...

This parameter relates the storage capacity to the size or the mass of the system, essentially showing how much energy (Wh) can be stored per unit cell, unit mass (kg), or unit volume (liter) of the ...

These circuit protection devices safeguard the electrical system and any connected devices from potential damage caused by electrical faults. Utilizing a PDM can help reduce the risk of electrical ...

Energy storage systems are essential in modern energy infrastructure, addressing efficiency, power quality, and reliability challenges in DC/AC power systems. Recognized for their indispensable role in ...

These systems use an AC connection between the power source (like inverters) and the battery storage, meaning energy is first converted to AC power before reaching the battery.

Energy storage is the capture of energy produced at one time for use at a later time [1] to reduce imbalances between energy demand and energy production. A device that stores energy is generally ...

Predictive maintenance (PdM) uses condition monitoring tools and machine learning (ML) algorithms to predict potential failures, faults, and deterioration for assets and equipment.
