

1. Introduction As the growing development of renewable energy industry sizes of wind turbines are increasing sharply with more degrees of freedom. The dynamic characteristics are ...

A comprehensive performance comparison of four dampers, tuned mass damper (TMD), TRCD, ETRCD, and the proposed ETRCD-C, is conducted, with all dampers optimally tuned via ...

This study investigates the impact of wind and wave loads on TMD damping effectiveness and proposes a comprehensive damping strategy involving TMDs installed in both the nacelle and ...

Meanwhile, the damping performance of TMD in all directions and limitation of installation space in nacelle need to be studied further. Consequently, this study proposes a new TMD design, and then ...

In this paper, a novel tuned mass damper refitted via inner platform (IP-TMD) is proposed to control the excessive vibration of steel wind turbine tower (WTT).

To verify the improvement advantage and applicability comparatively, a comprehensive experimental study is carried out to investigate the vibration suppression of PSTMD in this paper.

Installation TMDs made by ESM reduce the vibration levels for the different installation phases of the tower and allow more flexibility when planning the erection of wind turbines. ESM installation TMDs ...

We would be pleased to support you in solving your problem concerning "Wind turbine vibrations" and advise you on questions regarding our system and service offerings in the areas of structural health ...

TMD: Tuned Mass Damper The tuned mass damper (TMD) module adds functionality to FAST v8 that simulates the addition of TMDs in the nacelle and/or tower for structural control.

Therefore, an active tuned mass damper (ATMD) using a virtual TMD algorithm is proposed to mitigate the along-wind vibration of the tower under parked and operational conditions.
